A selection of our pumps

Lubricators:

We have two robust and reliable electrical motor driven lubricators for automatic greasing of machines. Can be combined with progressive systems.

Lubricators, type F

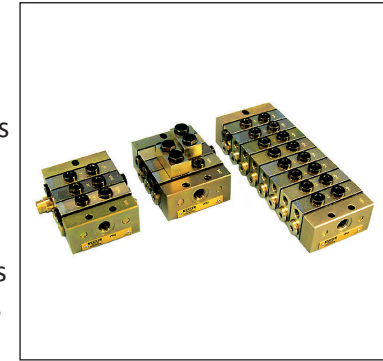

Grease spraying:

A simple and reliable greasing system for lubricating open gear drives, sliding surfaces, rotary ovens and debarking drums.

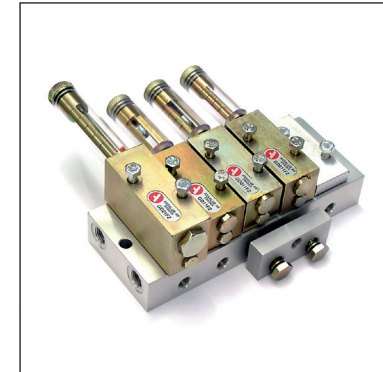

Progressive system:

For grease/oil. Consists of a main line which is branched via distributors to feed each lubrication point. We can supply both block distributors and element distributors as well as all accessories and components.

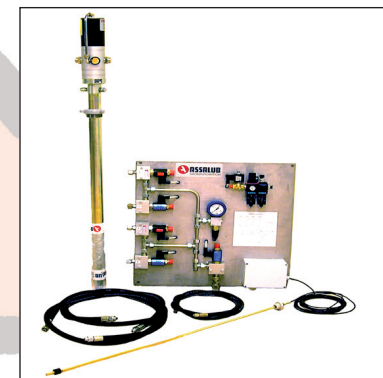

Dual line system:

Makes it possible to pre-set the correct amount of grease for each individual greasing point in a system. Suitable for heavy industry with high demands. Easy to change and to expand.

Single-line system:

An oil system that can also be used for fluid grease and thin grease. We have a complete range of dispensers, components and accessories.

The pump lift:

Our air-operated pump lift is equipped with an operating valve and has mounting holes in the bottom. Fits 200 and 50 kg drums. Also available in a version with wheels. Makes drum-change a less heavy task.

Pumps:

We manufacture a wide range of high-quality air-operated pumps for grease and oil. Available with many different ratios. We can also offer an electrical pump as well as several hand pumps.

The Grease Meter:

Our grease meter makes it easy to use the exact right amount of grease when greasing manually.

LubeRight:

RFID-based computerized hand greasing system. Identifies and keeps track of each greasing point so that every point is given the correct amount with the correct interval. Makes it possible to track each individual greasing over time.

LubeMon:

A tool for monitoring one or several important lubrication points in a system. Offers advanced statistics and logging functions.
